ABSTRACT

As part of a larger study prepared to provide local leaders with information on socioeconomic characteristics and household attitudes in four Kentucky counties, this databook on Perry County is compiled from 1961 (open country area) and 1973 (open country and nonopen country area) surveys. The sampling procedure involved a random selection of small-area sample segments and then a random selection of households to be interviewed. Interpretive summaries are provided for the following survey components: (1) Residential Characteristics; (2) Household Characteristics; (3) Level of Living; (4) Occupational Characteristics; (5) Income Characteristics; (6) Social Participation; (7) Opinion of Change in Quality of Life in County, 1973; (8) Opinion of Change in Quality of Life in Own Family, 1973; and (9) Opinion of Quality of Life Change in the U.S., 1973. Significant survey responses indicated that when compared with the combined responses of all four counties surveyed, Perry County had proportionately more: change in country households; differences in attitudes concerning jobs (greater dissatisfaction with doing the same job, job importance, chances of getting ahead, retirement, and money earned); and dissatisfaction with politics, political parties, job opportunities, public housing, youth opportunities, and U.S. agriculture and land use. PREFACE

The purpose of preparing this databook is to provide local leaders and officials with information obtained from sample surveys of households in Harlan, Perry, Whitley and Wolfe counties. The data were compiled from surveys in 1961 and 1973--made for somewhat different but related purposes. Both surveys included information on selected social and economic characteristics and attitudes of the households and of family members thereby permitting comparisons of households at two points in time. The 1973 survey also obtained considerable information on attitudes about changes in aspects of the quality of life in each county since 1960.

Area sampling procedures were used in both instances to identify households from which information was obtained. In the 1961 survey only residents in open country areas of each county were interviewed, while the 1973 survey included residents of non-open country as well as open country areas. The sampling procedure involved a random selection of small-area sample segments and then a random selection of households to be interviewed in each segment. The sampling rate of open country households in each county was determined by dividing the number of open country households in each county by the total number of open country households in all four counties. Proportionate sampling rates also were used in non-open country areas. Consequently, the data obtained and summarized in the tables approximate those which would have been obtained if a simple random sample of households in all four counties had been drawn. In both surveys the person(s) interviewed were the household Head and/or Homemaker.

The survey in 1961 was made as part of an Agricultural Experiment Station research project on Factors in the Adjustment of Families and Individuals to Changing Conditions in Low Income Rural Areas. The 1973 survey is part of a research project on Rural Development and the Quality of Life in the Rural South. These studies--made in cooperation with Agricultural Experiment Stations in several southern states¹--reflect an interest in rural development, which has been maintained for more than a decade, by members of the Department of Sociology. Support of these research studies by the Agricultural Experiment Station, College of Agriculture, University of Kentucky, is gratefully acknowledged.

¹Agricultural Experiment Stations in the following states are cooperating with Kentucky in the present study: Alabama, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, and Texas.

INTERPRETIVE SUMMARY

Residential characteristics. In 1973 the great majority of Perry County families lived in single family dwellings which they owned. Single family houses predominated despite the substantial proportion (17 percent) of open country families living in mobile homes. Over 3 out of 4 open country houses were located on hard surfaced roads, and 22 percent of the families had moved at least once in the past 5 years. Moreover, nearly 1 out of 3 families would like to move from their present residence. Except for the higher proportion of country families in mobile homes and the more frequent desire among all residents to move, residential characteristics of Perry County households were much like those in the four survey counties combined (Harlan, Perry, Whitley and Wolfe).

Perry County home ownership in open country areas has increased during the past 12 years, access to the outside via a hard-surfaced road has improved dramatically, and the proportion of households on farms has dropped very low. The same trends were evident in the four counties combined, but to a somewhat smaller degree.

Household characteristics. The typical household in Perry County in 1973 consisted of 3 or fewer persons (65 percent) and had a male head (80 percent) who was married (74 percent) and had had between 5 and 11 years of schooling (56 percent). Fifty-one percent of the household heads were 50 years of age or older. In these respects Perry County households did not differ much from those in all four counties combined.

However, the characteristics of households in towns--Hazard and Vicco--differed from the country households and from those of households in towns in the other counties.¹ In part, this was because there were disproportionate numbers of older, female, widowed heads of households living in Hazard and Vicco, and in part because in the combined counties a higher percentage of heads of households in the towns than in the open country have had at least a high school education.

Compared with open country households in 1961, the open country households in 1973 were smaller, fewer contained children aged 18 or older, and the head of the household had had more schooling. In these respects, also, the change in the country households in Perry County has been greater than in the country households of the four counties combined. In other respects little change occurred between 1961 and 1973.

¹In the Interpretive Summary the terms country and town will be used to refer to the tabular data labeled open country (O.C.) and non-open country (N.C.), respectively.

Occupational characteristics. The typical household head in Perry County in 1973 was "fully able to work" (61 percent), was "employed full time" (62 percent), and liked most aspects of his job, except for his chances of getting ahead and the retirement and other benefits provided. Except for the latter reservations, the typical household head was like most heads of households in all four counties. As in the other counties, the largest numbers of male heads were laborers, operatives, and craftsmen, and only a quarter of the homemakers were employed.

In being able to work and in full time employment, heads of households living in the country were little different in 1973 from those in towns, nor did they differ from those in other counties in these respects. But there were many more town male heads employed in professional and managerial work than was the case in the country. This difference was also true of the four counties combined. More town than country homemakers were employed in both Perry and the other counties. Too few male heads in the Perry County towns responded to questions on occupational satisfaction to permit meaningful comparisons with country household heads.

Compared with 12 years ago, more male heads were laborers and craftsmen and fewer were operatives. It is not surprising, then, that proportionately fewer male heads of country households in 1973 disliked the steadiness of their work, and proportionately more disliked doing the same job, the lack of importance of the job, the chances of getting ahead, the retirement and other benefits, and the amount of money earned. In most of these respects the difference in attitudes (1961 and 1973) was greater than for those in all four counties combined.

Level of Living. Most families in Perry County (78 percent) live in 4-to-6 room houses, and an equal or larger proportion of the homes contain modern plumbing and kitchen facilities. Except for air conditioner and home freezer, more than half of the families have every convenience included in the survey. Central heating and telephone are the major conveniences that homes least often have.

The homes in the country tend to be somewhat smaller and less frequently contain modern conveniences, especially central heating and plumbing, than do homes in towns. Even so, country homes as well as those in towns in Perry County more often are modernized in these respects than homes in the four counties as a whole.

There has been substantial improvement in housing of open country residents in the past 12 years. Two out of 3 families today live in a 5-7 room house, compared to a little more than 1 out of 3 who did so in 1961. Moreover, most are now modernized. For example, all of the homes surveyed in 1973 had a gas or electric range compared to only 72 percent 12 years ago. Ninety percent, compared to 60 percent in 1961, had piped water, and 71 percent compared to 32 percent had hot water. Seven out of 10 today, compared to just over 2 out of 10 in 1961, have an inside toilet and shower, and nearly one-half have central heating compared to 1 out of 6 in 1961. The increase in material possessions parallels a decrease in the number of children and an increase in incomes.

Income. A third of Perry County families in 1972 had incomes below \$4,000, and these low-income families as often lived in towns as in the country. For most families the major source of income was wages, salaries, and profits from businesses (59 percent) and Social Security and pensions was the major source for the next largest number (38 percent). Most male heads of families (75 percent) regarded their income as satisfactory or very satisfactory, although 1 out of 3 thought it was not sufficient. In amount and source of income and satisfaction with their income, the people in Perry County were much like those in all counties surveyed, although somewhat fewer in Perry County had low incomes, or were dissatisfied with their income. Unlike the four counties combined, there was little difference between town and city people as to their major source of income.

Reflected in the improvement in level of living noted earlier was a substantial increase in the incomes of country families in the past 12 years; the proportion with incomes of \$4,000 or more nearly doubled, 36 to 67 percent. No doubt this was partly due to the increase in Social Security and pensions as a source of income. Despite the increase in income and level of living there has been little increase in the percentage satisfied with their incomes, reflecting the fact that wants increase as rapidly as do incomes.

Social Participation. Like people in all the counties surveyed, one-fourth of the families in Perry County do not participate in any formally organized groups, such as a church, lodge, or civic club. Moreover, although townspeople in Perry County participate more actively in such organizations than do country residents, the townspeople surveyed are less active than townspeople in the four counties combined. Country residents in Perry County are more active in formal organizations now than they were 12 years ago; 39 percent now compared to 31 percent 12 years ago have medium to very high levels of social participation.

The most popular leisure time pursuits are television viewing and other indoor activities, and various outdoor activities and spectator events. Except for the greater interest of townspeople in indoor recreational activities and a lower interest in outdoor activities, differences between town and open country residents or between people in Perry County and all four counties combined are small.

Opinion of Change in Quality of Life in Perry County. In its material aspects the quality of life has improved markedly in the past 12 years, and in mid-1973 nearly two-thirds of the heads of households surveyed felt that "in general and on the average" the quality of life for most people in the county had improved during the past decade. The people in towns who expressed opinions more often felt this was true (78 percent) than those in the open country (60 percent), and this town-country difference in the perception of improvement is characteristic of the people surveyed in all four counties.

Specific aspects of the quality of life in which most people thought improvement had occurred over the past decade were public schools, higher educational opportunities, medical care and services, welfare programs, the situation for poor people, transportation and roads, incomes,

public utilities, opportunities for older people and for Blacks, and the county as a place to live. At the same time, a majority (50 percent or more) consider the current situation to be "pretty good" or "very good" for only 7 of these 11 aspects: public schools, higher educational opportunities, welfare programs, the situation for poor people, incomes, public utilities, and the county as a place to live (a majority also rate religion the same way). A higher percentage of people living in Hazard and Vicco than those living in the country thought that the quality of welfare programs, roads, and incomes had improved and proportionately more of the town than the country people thought the current situation in these respects was pretty good or very good. Town people also more often than country people rated the current situation as very good in respect to higher educational opportunities and the county as a place to live. But town people were much lower than country people in their rating of the improvement and current situation of medical care and they less often saw improvement in the situation of old people. Otherwise country and town people were equally likely to say that each of these 11 aspects of the quality of life had improved and the current situation was good. Finally, in these aspects of the quality of life that most people in Perry County feel have improved, the percentage with this attitude in each case except medical care and services and transportation was about the same as or a little greater than for people in all four counties combined.

As most local people view the past decade, several aspects of the quality of life in Perry County have not improved. The opinions of most people were that the quality of county government had not changed and the current situation is only fair. Similar views are held with respect to politics and political parties, law enforcement, obedience to law, job opportunities, religion, physical environment, public housing, buying power, recreational opportunities, and opportunities for young people. Those in the country were less inclined than those in towns to see improvement in the quality of county government, law enforcement, and public housing, and more inclined to say that buying power and opportunities for young and old people had improved. Compared to all four counties combined, Perry County assesses less favorably their politics and political parties, job opportunities, public housing, and opportunities for youth. In other respects they don't differ much from the four county average.

Most people in Perry County, regardless of residence, felt that the situation for agriculture and land use had worsened in the past decade, and a higher proportion in Perry County held this opinion than in all four counties combined.

Opinion of change in quality of life in own family. While 51 percent of the families in Perry County felt that the quality of life for their own family five years ago was good or very good, 62 percent felt this way when interviewed in the early summer of 1973. On the other hand, 1 out of 5 felt that the quality of their life was fair or very poor five

years ago, but only 1 person in 15 felt it was still this poor. Moreover, although 9 percent felt that the change in their family situation during the past 10 years had been for the worse, 60 percent felt that it now was somewhat or much better than formerly. In rating their family situations five years ago and in mid-1973, and in their opinions about improvement during the past 10 years, relatively fewer open country than town residents felt that their situation was good or had significantly improved. In these respects town-country differences in Perry County are like those in all counties studied.

Opinion of quality of life change in the U.S. Although 50 percent of the persons interviewed in Hazard and Vicco felt that the quality of life in the U.S. was getting better, only 29 percent of the country respondents felt so, and, in general, opinion was quite divided as to the nature of change. Town-country differences were in the same direction in the four counties combined, but not as sharp as in Perry.
